

Madalina-Eleonora Gheorghe

Senior UI / Frontend Engineer · Angular & TypeScript | UX-driven product thinking

Bucharest, Romania | madalinaeleonora.gheorghe@gmail.com | +40 768 792 728

LinkedIn: [in/madalinaeleonora](https://www.linkedin.com/in/madalinaeleonora) | Portfolio: madalinaeleonora.github.io

PROFESSIONAL SUMMARY

UI Engineer with **7+ years** of software engineering, building complex enterprise web applications in Angular and TypeScript: micro-frontend estates, data-heavy administration interfaces, and the shared component and design-token layers underneath them. What I reach for first is how a product should *work and feel* for the person using it. I've owned UI/UX direction end to end, and colleagues have twice called me the team's "unofficial screen designer". I challenge requirements so stories come out better structured, and make complex, permission-heavy workflows feel simple.

CORE EXPERTISE & SKILLS

Product & UX: UI/UX ownership, requirements analysis & discovery, wireframing, user flows & states, responsive design, accessibility (hands-on WCAG 2.1 / ARIA), Figma, design tokens & theming.

Architecture & Frontend: Angular (v2 to v21), TypeScript, JavaScript (ES6+), semantic HTML, CSS, Sass, Micro-Frontends (MFE), Module Federation, Nx monorepos, reactive state (Signals, NgRx SignalStore), zoneless Angular, RxJS, WebSockets, React, AG Grid, Angular Material 3, shared component library and design system maintenance.

Backend-adjacent, Testing & CI/CD: REST APIs, OpenAPI / SDK generation, npm library publishing (ng-packagr), Keycloak / OIDC, Java (basic), Jest, Jasmine, unit & contract testing, code review, Git, BitBucket, GitHub Actions, Docker, ArgoCD, Jenkins.

AI-assisted development: Claude Code (CLI agents), MCP tooling, AI-assisted refactoring and code review.

Leadership & ways of working: E2E delivery ownership, Agile / Scrum, sprint planning, technical interviewing & hiring input, cross-team mentoring, stakeholder communication.

Languages: Romanian (native), English (full professional proficiency).

PROFESSIONAL EXPERIENCE

SS&C Technologies — UI Engineer

Hybrid, Bucharest · Sep 2025 – Present

Digital Technology and Development team. Five financial-services administration products on one shared UI foundation, as the organisation consolidates from a separate codebase per client to one configurable platform serving all of them.

- **Code owner of the access-and-permissions platform (RBAC)**, in production and used across our organisation to enrol and administer who can reach our products, each person reaching all of it or only part of it according to their own role. Refactored and improved it, took it to **Angular 21** and reworked the interface.
- **Eleven Angular applications behind one shell** (Nx, Module Federation, each area loading only for a user entitled to it), replacing a monolith that could not be maintained. **Six of the eleven I built from scratch**, the other five I inherited and improved.
- Built the **permission-import** feature that makes configuring a new client easier. Importing is destructive, so users were afraid to use it; it now shows exactly what it will change before changing anything. Also built **delegated access**, multi-factor-authentication management, and the configuration behind **in-app notifications**. Redesigned the notification widget the lead started: a design per notification status, and important ones that cannot be deleted.
- **Moved the table filters into the table**. Screen space was the constraint, so the filter went into each column header instead of a row of boxes above the grid, across all the existing tables.
- Consolidating components copy-pasted across **seven applications** into one themable kit of **33** components with virtual scrolling, carrying **~1,050** tests, having made the case by measuring it: forks larger than the originals they simplified, pairs kept byte-identical by hand. Migrated Angular Material M2 to **Angular Material 3** unprompted.
- **Rebuilt the last application left in the legacy codebase so it could finally be archived**, reconstructing unfinished behaviour from the original documentation. Co-maintain the platform's **TypeScript SDK**, generated from **14 OpenAPI specifications** into four published npm packages.
- **Recognised in a call across the whole services group** for having been through every one of the projects and improved them, and named one of the people it relies on.

- Extended the product design from our designer's first draft of header and sidenav placement: designed the screens it did not cover, then applied and refined the result across the estate, with accessibility written into each component (ARIA, keyboard, per-row table labels, focus restore). Ran the technical interview for **two** partner-vendor engineers joining the team, mentor engineers, and **automate the repetitive half of the delivery work I own with AI tooling** as a personal workflow.

Cognizant — Frontend Developer & Interim Team Lead

Remote · Jan 2023 – Sep 2025

Banking fraud-targeting platform and employee access-management system

- Started a fraud-detection platform for a **Belgian retail bank** with the tech lead: **11** Angular screens where the bank's security agents review suspicious transactions and decide whether to allow, block or telephone the customer. Integrated AG Grid for bulk reclassification across **50,000+** records, guarded by business rules in both frontend and backend so an agent could not get it wrong, with role-based access control (RBAC) throughout and WebSockets for live status changes.
- Won UI/UX decision authority by arguing the agent's first-time perspective against flows the business analysts had mapped from their own, which ended with me in the feedback sessions with agents and their department managers. A manager review listed UX design among the tasks I took on outside the role.
- Interim Team Lead after the tech lead's departure: frontend architecture decisions, an Angular version upgrade, CI/CD deployments, sprint planning, and release ownership from the third release onwards with **zero** production incidents across the releases I owned. Brought two under-delivering colleagues from one story in two weeks to one in three days.
- Also started an employee access-management system with the same lead, took it to MVP, and stayed its point of reference for difficult Angular and business decisions after it moved to another team. Mentored on Angular practice and Jasmine unit testing throughout.

Deloitte Digital Romania — Frontend Developer

Remote · Oct 2021 – Dec 2022

- Sole frontend developer for **11 months** on an internal banking application (React, TypeScript, Mambu), building client-profile, loan creation and refinancing, and onboarding workflows. Took over the Java PDF transaction-history reports the bank's staff relied on, making the API changes myself when backend developers were unavailable, then paginating the document and adding the bank's legally required header and footer.
- Built the purchase and **mid-term adjustment** flows for an insurance product MVP (Angular, RxJS): upgrading a live policy and paying only the difference, upgrades only. Improved the product's consistency and usability through daily work with the designer as the frontend's feasibility voice.

IBM — Frontend Developer (joined as intern)

Bucharest · Dec 2018 – Oct 2021

- Product-browsing and cart team on an AEM-driven e-commerce platform serving **6** grocery brands for **Albertsons** (Angular, TypeScript, plain JavaScript), integrating with other teams' applications through shared browser storage. Built roughly **90%** of the coupon experience across search, product and mini-cart surfaces, with pricing and order totals recalculating in real time, plus store-location logic driving stock, delivery pricing and pickup availability. Everything shipped behind advertising-controlled **feature toggles**, so most components ran as two live versions at once. ARIA, keyboard and screen-reader (VoiceOver) accessibility were client-mandated and tester-verified on every ticket.
- One of 7–8 developers on an offline-capable tablet application for **Munich Re** repair technicians (Angular, Ionic, Capacitor): verify that an appliance is covered, record the repair, photograph proof and capture a legally valid customer signature, on unreliable connections in customers' homes. Also built the frontend for a company-wide document platform searching inside **10,000+** files, and hand-remediated dependency vulnerabilities in an ageing device-compliance app. Three on-site trips to Munich.
- Mentored juniors, onboarded new joiners into the wider IBM iX practice, and was the US client's point of contact, working US hours from Romania.

EDUCATION & AWARDS

Romanian-American University — Faculty of Managerial Informatics, Bucharest

Master of Science, Computer Science for Economics · Grade: **9.66/10**

2018 – 2020

Bachelor of Science, Computer Science for Economics · Grade: **9.50/10**

2015 – 2018

Awards: 1st place, Web & Mobile Challenge, DevHacks · 2nd place, RAU DevHack hackathon

Per-project detail and full performance reviews: madalinaeleonorag.github.io
